## Editorial

### Dear *Gymnocalycium* enthusiasts

Mario Wick

In this issue of Schütziana we proceed with the overview on the seeds of the genus *Gymnocalycium*, with the subgenus *Gymnocalycium*.

The species of this subgenus turn out to be very interesting. With one exception, all new first descriptions at species level of the last three years are about representatives of this group:

*Gymnocalycium alenae* Kulhánek 2017 (Argentina, Province Córdoba, subgenus *Gymnocalycium*)

*Gymnocalycium ponomarevae* Gapon et Neuhuber 2017 (Argentina, Province Córdoba, subgenus *Gymnocalycium*)

*Gymnocalycium ilseae* F. Berger 2016 (Argentina, Province Córdoba, subgenus *Gymnocalycium*)

*Gymnocalycium kulhanekii* Papsch 2016 (Argentina, Province Córdoba, subgenus *Gymnocalycium*)

*Gymnocalycium pinalei* Meregalli & Kulhánek 2016 (Argentina, Province Córdoba, subgenus *Gymnocalycium*)

*Gymnocalycium campestre* Řepka 2015 (Argentina, Province Córdoba, subgenus *Gymnocalycium*)

*Gymnocalycium mendozaense* Bercht & Schädlich 2015 (Bolivia, subgenus *Muscosemineum*)

Except for *G. mendozaense*, the special thing of these species is that they are all native to northern Córdoba. Here there seems to exist a kind of 'hotspot' of the development of this subgenus. Not every population in this area can be unambiguously assigned to a described species. Here we simply cannot go any further with morphological comparisons. Polyploidy, hybridisation, recombination and separation seem to allow the plants to develop the characteristics of different species. As always, here we have only a snapshot of nature, which is especially regrettable in this case.

Unfortunately, we do not yet have the material of the recently described species *Gymnocalycium ponomarevae* Gapon et Neuhuber available for publication. We will cover this species later.

Have fun leafing through and gazing!

We would like to express our warmest thanks to Mrs Iris Blanz (Fernitz, Austria), to Mr Brian Bates (Bolivia) and to Mr Graham Charles (United Kingdom), who support us with the translation into English, to Mrs Larisa Zaitseva for the translation into Russian (Tscheljabinsk, Russia), to Mr Takashi Shimada (Japan) for the translation into Japanese and to Mr Daniel Schweich (France), who has mirrored our publications under <http://www.cactuspro.com/biblio/>.

### ABSTRACT

The authors present a paper about those *Gymnocalycium* species which they accept. The species are introduced with one photograph of their habitat, one of their environment and one of their seed respectively (if available). A map of each plant's locality completes the presentation. Part 2 deals with the subgenus *Gymnocalycium*.

**KEYWORDS:** Cactaceae, *Gymnocalycium*, subgenus *Gymnocalycium*, affine, alenae, amerhauseri, andreae, baldianum, berchtii, borthii, bruchii, calochlorum, campestre, capillense, carolinense, erinaceum, erolesii, fischeri, frankianum, gaponii, gertii, gibbosum, ilseae, kieslingii, kroenleinii, kuehhasii, kulhanekii, marianaee, meregallii, morroense, nataliae, neuhuberi, papschii, parvulum, pinalii, platense, poeschlii, reductum, robustum, schreiteri, strigianum, sutterianum, tandingaense, uebelmannianum.

### INTRODUCTION

In the second part of our work on the seeds of the genus *Gymnocalycium* we present the species of the subgenus *Gymnocalycium*.

For compiling the maps, we used the free GIS software QGIS (<http://www.qgis.org/de/site/forusers/download.html>). The background of the maps is formed by Google Inc. data, which can be combined in QGIS with the QGIS extension Quick Map Services (<http://nextgis.com/blog/quickmapservices/>) by Nextgis company (<http://nextgis.com/>).

Type species of the subgenus *Gymnocalycium* is *Gymnocalycium gibbosum* (Haw.) Pfeiff. ex Mittler (1844).

## Genus *Gymnocalycium* Pfeiffer ex Mittler (1844)

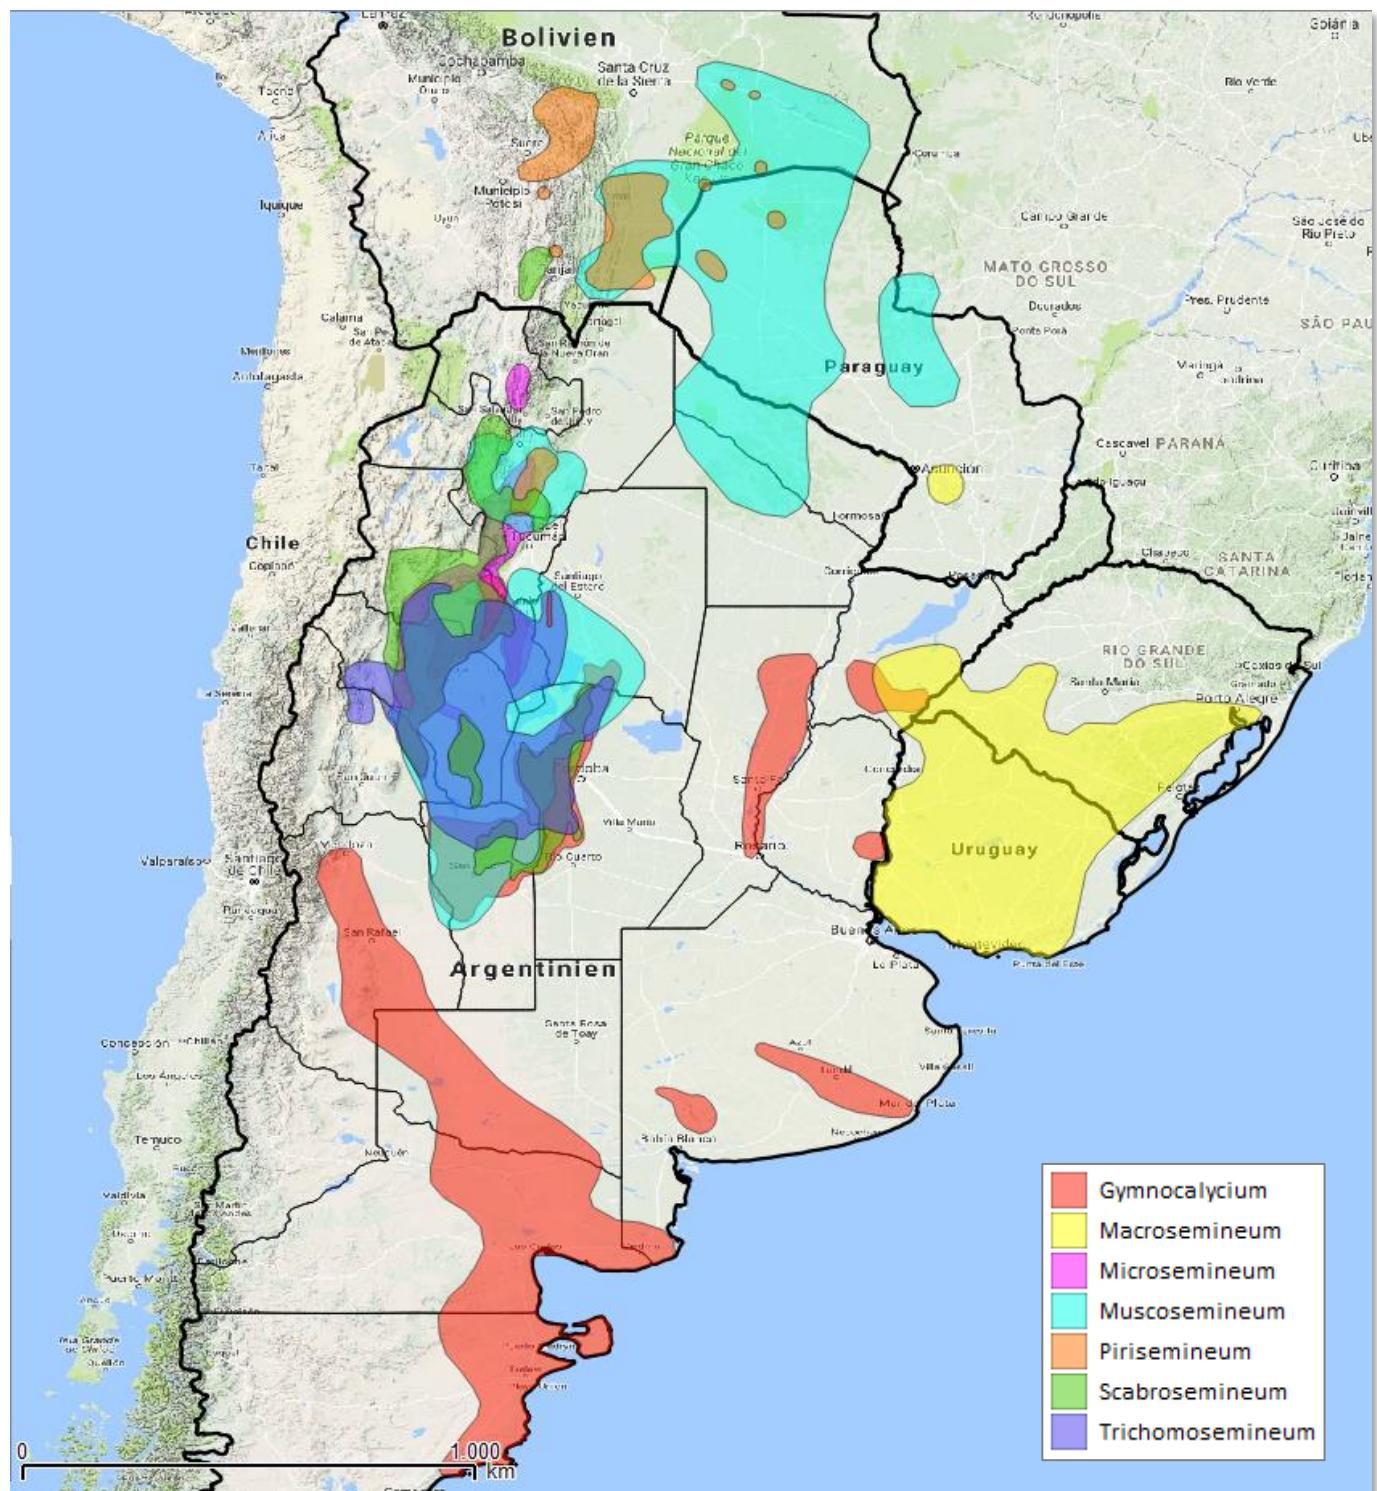

Fig. 1: Overview map of the distribution areas of the subgenera of the genus *Gymnocalycium*

## Subgenus *Gymnocalycium*

**Body:** very small to medium large, flat, spherical or short columnar, with fibrous or tap root, **Spines:** from almost hairy to very strong and stiff, straight to bent, **Flowers:** from the apex, funnel- to bell-shaped, often large, **Fruits:** spherical, fusiform or clavate, brown, grey green or green, often grey or blue pruinized, dehiscing vertically, **Seeds:** 0.9-1.1 mm in size, **Testa:** with protuberances, matt to matt-glossy, brownish to black, usually with a partly or entirely detaching brownish cuticle, seeds within this subgenus relatively uniform, **Locality:** Argentina and Uruguay.
